

42-hour power reserve movement

What is the power reserve of an automatic watch?

In other words, the power reserve is the time from when the mainspring is fully wound to the moment the watch stops. For calculating the power reserve of an automatic watch, it's important for it to remain stationary, as the winding rotor would otherwise supply the mainspring with more energy with every movement.

What is a power reserve indicator on a watch?

A power reserve indicator on a mechanical watch displays the time the watch is powered for from fully wound and indicates the amount of power left in the mainspring at any given moment. It measures the energy as the watch's spring uncoils.

Does the length of the mainspring affect the power reserve?

The length of the mainspring directly correlates with the power reserve of a watch. The longer the mainspring, the longer the power reserve or the reduction of the vibration, i.e., from 28'800 A/h to 25'200 A/h. (less vibration, less energy needed).

How does a power reserve device work?

The principle of any power reserve device is that when the mainspring is wound either automatically or manually, a special train of gears connected to the ratchet wheel or the barrel arbor drives the power reserve indication showing the extent of the wind.

The watch features a Miyota Caliber 8215 21-jewel automatic movement with a 42-hour power reserve and calendar. The exhibition case back showcases the fine movement and features the song title as well as the iconic Fedora Hat, which can also be found etched on the crown. The brown lizard grain textured leather strap features a deployant buckle ...

The power reserve is at the 6 position on this automatic watch. Here it is indicating that 25 out of 40 hours remain. A power reserve indicator (originally called *Réserve de Marche*) is a complication of the watch, which is designed to show the amount of remaining stored energy. The power reserve indicator indicates the tension on the mainspring at any particular moment.

The MIYOTA Cal. 9075 is a Japanese automatic GMT movement with a 42-hour power reserve that operates at 28,800 vph. It has 24 jewels, hacking, hand-winding, and it's rated at -10/+30 seconds per day from the factory. More recently, MIYOTA has offered an upgraded option to equip the movement with heat-blued screws. At this price point, most ...
