The average temperature coefficient for a solar panel is $-0.32\%/^{\circ}\text{C}$, which means for every degree above 25°C , a solar panel's output falls by a miniscule 0.32%. However, even if your solar panels were to reach the dizzying heights of 50°C , they would still be operating at roughly 92% of their original capacity - not a very significant loss at all.

When translating your energy needs into solar panel numbers, remember that a typical 350W solar panel produces around 265kWh per year in the UK. So if you use 2,650kWh of electricity annually, you can theoretically provide it all with 10 solar panels. If you only use 1,500kWh or less, then a six-panel array will be sufficient for your needs.
