Nanoparticles of various chemical compositions have demonstrated great potential for high-rate energy storage. For typical Li-ion battery materials, such as LiCoO 2, Si, Ge and so on ...

There is a long history of investment in these technologies. Due to its high demand from various sectors beyond just grid energy storage, batteries such as Lithium-ion batteries have become efficient energy storage systems with high energy and power density, reliability, and cyclability [30], [31], [32].

Besides the above batteries, an energy storage system based on a battery electrode and a supercapacitor electrode called battery-supercapacitor hybrid (BSH) offers a promising way to construct a device with merits of both secondary batteries and SCs. In 2001, the hybrid energy storage cell was first reported by Amatucci.

To meet the growing energy demands in a low-carbon economy, the development of new materials that improve the efficiency of energy conversion and storage systems is essential. Mesoporous materials ...
