How to apply phase change energy storage in New Energy?

Application of phase change energy storage in new energy: The phase change materials with appropriate phase change temperature should be selected according to the practical application. The heat storage capacity and heat transfer rate of phase change materials should be improved while the volume of phase change materials is controlled.

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

Do phase change materials reduce energy consumption?

Phase change materials (PCMs) possess exceptional thermal storage properties, which ultimately reduce energy consumption by converting energy through their inherent phase change process.
