How can energy sector reforms improve women's and girls' living conditions?

Reforming the energy sector in a more gender-sensitive way through obtained evidence is a pivotal step for the improvement of women's and girls' living conditions, and the impact of informed energy sector interventions leads to more effective outcomes.

Is gender in the transition to energy for all?

ENERGIA, in collaboration with nine research teams, is delighted to release a new report " Gender in the transition to energy for all: From evidence to inclusive policies " presenting a synthesis of the evidence generated by the five-year research programme.

Why do energy businesses need women?

For energy businesses, women are central actors as they access untapped markets, build trusting relationships with potential customers and provide service quality which builds customer confidence. Statistical data from Ghana and Tanzania state that productive uses of energy can contribute to women's economic empowerment (RA6).

Do men and women have different energy needs?

The research emphasises that men and women have different energy needs, control over and access to energy resources and services. To be effective and not gender-neutral, energy policies must address this differentiation to ensure equitable access to energy services between men and women.

Does a gender approach improve energy access?

The new report released by ENERGIA, in collaboration with nine research teams, gathers the empirical evidence related to the benefits that taking a gender approach has for energy access interventions, with the aim to translate this evidence into recommendations for energy policy and practice.

How can modern energy services improve women's empowerment?

In the domain of employment, gender norms, values, customs and habits hinder women's empowerment, even though studies show that use of modern energy services can contribute to increasing gender equality and changing these gender norms. Women can also take advantage of political processes to gain better energy access and change gender norms.

Can girls learn about new energy storage

We must inspire young girls to join the energy research community to ensure a sustainable energy future. One way to do this is by introducing them to successful women who have made significant contributions and overcome obstacles in this field.

On 15 July, national plans for energy storage were set out by the Chinese National Development and Reform Commission and National Energy Administration. The main goals of new energy storage development include: Large-scale development by 2025; Full market development by 2030. The guidance covers four aspects: 1) Strengthening planning guidance ...

Lift Energy Storage Technology involves transforming tall buildings into batteries that can provide power for urban settings. (Image Credit: Energy (2022). DOI: 10.1016/j.energy.2022.124102) Now that renewable energy generation costs are decreasing, demand for energy storage technologies, which could

The Levelized Cost of Storage (LCOS) is a measure of the average cost of energy storage over a project's lifetime, and can be used to compare the economics of different storage applications. LCOS analysis can get complicated, but in general, wholesale and utility batteries are more cost competitive than smaller residential ones.

The transition to renewable energy sources such as wind and solar, which are intermittent by nature, necessitates reliable energy storage to ensure a consistent and stable supply of clean power. The evolution of LDES Long-duration energy storage is not a new concept. Pumped hydro-electric storage was first installed in Switzerland in 1907.

When girls opt -out of science-related disciplines because of gender-related barriers and norms, we collectively lose out on opportunities to drive the energy transition forward at scale and ...

This webinar presented the opportunity to discuss the role of women in the energy transition from different points of view: are EU energy policies sufficiently inclusive? Is it appropriate to ...

A key component of that is the development, deployment, and utilization of bi-directional electric energy storage. To that end, OE today announced several exciting developments including new funding opportunities for energy storage innovations and the upcoming dedication of a game-changing new energy storage research and testing facility.

Liquid-to-air transition energy storage Surplus grid electricity is used to chill ambient air to the point that it liquifies. This "liquid air" is then turned back into gas by exposing it to ambient air or using waste heat to harvest electricity from the system. The expanding gas can then be used to power turbines, creating electricity as ...
