Could 3D zinc microstructured sponge technology improve EV battery rechargeability?

EnZinc is developing a low-cost battery using 3D zinc microstructured sponge technology that could dramatically improve the rechargeability of zinc-based EV batteries. As a battery material, zinc is inexpensive and readily available, but presently unsuitable for long-term use in EVs.

Can EV batteries supply short-term storage facilities?

For higher vehicle utilisation, neglecting battery pack thermal management in the degradation model will generally result in worse battery lifetimes, leading to a conservative estimate of electric vehicle lifetime. As such our modelling suggests a conservative lower bound of the potential for EV batteries to supply short-term storage facilities.

Will electric vehicle batteries satisfy grid storage demand by 2030?

Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained. Here the authors find that electric vehicle batteries alone could satisfy short-term grid storage demand by as early as 2030.

How will EV batteries help the energy transition?

Provided by the Springer Nature SharedIt content-sharing initiative The energy transition will require a rapid deployment of renewable energy (RE) and electric vehicles (EVs) where other transit modes are unavailable. EV batteries could complement RE generation by providing short-term grid services.

Should EV batteries be used as stationary storage?

Low participation rates of 12%-43% are needed to provide short-term grid storage demand globally. Participation rates fall below 10% if half of EV batteries at end-of-vehicle-life are used as stationary storage. Short-term grid storage demand could be met as early as 2030 across most regions.

Does technical EV capacity meet grid storage capacity demand?

Technical vehicle-to-grid capacity or second-use capacity are each, on their own, sufficient to meet the short-term grid storage capacity demand of 3.4-19.2 TWh by 2050. This is also true on a regional basis where technical EV capacity meets regional grid storage capacity demand (see Supplementary Fig. 9).
