How do thermal metamaterials and devices manipulate heat transfer?

In this Review, we discuss studies on various thermal metamaterials and devices in a unified framework, that of the manipulation of heat transfer through their unusual thermal conductivity and emissivity, which correspond to the two main forms of heat transfer: conduction and radiation.

What are the main concerns of heat transfer studies?

The main concerns of heat transfer studies are temperature and heat flux management-- heating or cooling targets to suitable temperatures; and energy harvesting -- converting the thermal energy from a heat source (such as the Sun) to work or to other forms of energy.

Does giant thermal magnetoresistance enhance near-field heat transfer in InSb-Ag nanoparticles? Giant thermal magnetoresistance was predicted to enhance the near-field heat transfer in InSb-Ag nanoparticles exposed to orthogonal magnetic fields, owing to the spectral shift of localized surface waves 223.

Which paper describes near-field heat transfer?

Phys. Rev. B4, 3303-3314 (1971). This paper theoretically describes near-field heat transfer. Volokitin, A. I. & Persson, B. N. J. Near-field radiative heat transfer and noncontact friction. Rev. Mod. Phys.79, 1291-1329 (2007). He, J. & Tritt, T. M. Advances in thermoelectric materials research: looking back and moving forward.

How does thermal radiation carry heat?

Thermal radiation carries heat in the form of photons or electromagnetic waves. When the distance between objects is larger than the wavelength of the thermal radiation (the thermal wavelength), the radiation is in the far-field regime.

Why is heat transfer important?

Studies that aim at using heat transfer for purposes such as heat engines or thermal memories are beyond our scope, as are traditional devices such as heat sinks and heat pipes. Heat conduction is the main form of heat transport in solids. Engineering the thermal conductivity is central to its manipulation.

Electromagnetic (EM) heating is an emerging method for storing renewable energy, such as photovoltaic solar and wind electric power, into aquifers. We investigate how the captured energy increases the temperature of a prototypical deep aquifer for a six-month period and then to which extent the stored energy can be recovered during the consecutive six ...

Heat transfer occurs when thermal energy moves from one place to another. Atoms and molecules inherently have kinetic and thermal energy, so all matter participates in heat transfer. There are three main types of heat transfer, ... Radiation is the emission of electromagnetic radiation. While it occurs through a medium, it does

not require one.

Thus, it leads to higher temperature homogeneity in the reaction mixture. In other words, the microwave-assisted route is an energy conversion process, where the conversion of electromagnetic radiation into heat energy occurs instead of heat transfer by convection in conventional heating [102]. Therefore, utilizing the microwave irradiation ...

Abstract: This paper concerns the application of the electromagnetic induction heating technology in heating molten salt in a heat storage system. An experimental system was set up for electromagnetic induction heating of molten salt and temperature variation of molten salt and coil cooling water under different molten salt velocity and coil current conditions were investigated.

In the present study, we develop a numerical model that can simultaneously calculate hydrogen and heat transport combined with electromagnetic induction heating of metal particles. To the best of our knowledge, this is the first numerical model of hydrogen transport that handles the electromagnetic energy transfer, heat transfer, and mass transfer.

this heat in thermal energy storage for later use. Compared to conventional systems that convert wind to electricity, WTES can be a cost-effective solution for producing heat from wind power due to its minimal energy conversion steps. Two challenges in the development of WTES are

A material is classified as dielectric if it has the ability to store energy upon application of an external electric field. If a direct current (DC) voltage source is placed across a parallel plate capacitor (Fig. 5.1), more charge is stored when a dielectric material is located between the electrodes. The dielectric material increases the storage capacity of the capacitor ...

Industrial malting operations use ~800 kWh/t of energy to produce the heat required to kiln malt. Electromagnetic heating technologies are suggested as a way to potentially improve the energy efficiency of the kilning processing. In this work, the potential for using electromagnetic heating to dry malt to commercially acceptable moisture levels whilst ...

The future of heating will strongly influence the scale and shape of electricity demand in regions with cold winters, and there is an important set of decisions to be made about ways of providing heating services, especially in countries that rely heavily on fossil fuels for this (Eyre and Baruah 2015). These decisions will be informed by estimates of heat demand ...
