The authors in have presented an energy storage management system based on fuzzy logic to support a shipboard power system with a medium-voltage DC system. From the environmental point of view, the authors of [ 16, 17 ] propose a multi-objective minimisation method so as to decrease operation cost and pollution caused by fossil fuel consumption.

The energy storage control system of an electric vehicle has to be able to handle high peak power during acceleration and deceleration if it is to effectively manage power and energy flow. There are typically two main approaches used for regulating power and energy management (PEM) [ 104 ].

Batteries are the most common form of electrochemical energy storage, used in everything from small electronic devices to large-scale grid storage systems. Read more: Energy Storage Sysems. Conclusion. Energy management is a critical for energy storage systems, ensuring they operate efficiently, reliably, and sustainably.
