The consumed electric energy is 1.48 MWh, the total output electric energy is 0.413 MWh, and the round trip electrical efficiency is 27.9%. The heat exergy supply for heating is 0.1982 MWh, the thermal efficiency ...

The most desirable for such system is that the same components that convert electrical energy during storage do the opposite in the discharging process. This reversibility with good efficiency in operation, is only possible for the hydraulic pump-turbines and volumetric compressor-expanders.

In general, a CAES system refers to a process of converting electrical energy to a form of compressed air for energy storage and then it is converted back to electricity when needed. An illustrated conventional CAES system is plotted in Fig. 1. During the charge process, air is pressurised by compressors which are driven by motors using off ...
