What is a liquid cold plate?

A Liquid Cold Plate (LCP) is responsible for efficiently transferring heat from surfaces with high heat loads to the fluid used within a liquid cooling system. The performance of the liquid cold plate is critical in defining the overall effectiveness of a liquid system. Reliable, 100% leak tested cold plates produced for decades.

Does a cold plate cool a device?

A cold plate by itself does not cool devices; it must be integrated into a liquid loop that includes a pump for fluid circulation and a heat exchanger to reject the heat absorbed by the cold plate. Why use Liquid Cold Plates? Leverage the high heat capacity of liquid to quickly absorb more heat than air cooled thermal management solutions.

Are ADV liquid cooling plates retired?

ADV liquid cooling plates use vacuum brazing, friction stir welding ...and various frequency welding technology to ensure every unit of our cold plate was crated with high advanced manufacturing process and fully tested before they leave "home", we are proud to announce some of them are 20+years now ,and they are still not retired.

How can water cooled plates improve the performance?

We currently have the latest phase change technology on the stability of the water-cooled plate, which can reduce the volume of the product and make the performance more reliable. Welding, ADV conventional water-cooled plates use Vacuum brazing, Friction stir welding and Induction welding.

What are ADV cold plates used for?

ADV cold plates are widely used in SVG, new energy vehicles, induction heating power supplies, electroplating power supplies, laser power supplies, etc. Over the years, they have provided many customers with water-cooling plate design optimization solutions. The process is mature and experienced, and they have won the trust and praise of customers.

What is a heat dissipation plate?

The surface of the plate has the same temperature value, and its power depends on the heat exchange area and friction of the liquid. It is suitable for heat dissipation of ultra-high-power components that cannot be completed by air cooling. Thereby reducing the size of the whole machine. The internal liquid is usually customized by the customer.

In 2021, a company located in Moss Landing, Monterey County, California, experienced an overheating issue with their 300 MW/1,200 MWh energy storage system on September 4th, which remains offline.

A liquid cooling plate is a device designed to transfer heat away from electronic components and into a liquid coolant that flows through embedded channels within the plate. This technology is crucial in applications where air cooling is insufficient, such as in high-powered electronics, laser devices, and power converters.
