The braking system is engineered to transform the vehicle's kinetic energy into thermal energy. It comprises various components such as brake pads, brake rotors, calipers, and brake fluid. When the driver engages the brakes, the brake pads press against the brake rotors, creating friction that reduces the speed of the vehicle's wheels.

TES systems are divided into two categories: low temperature energy storage (LTES) system and high temperature energy storage (HTES) system, based on the operating temperature of the energy storage material in relation to the ambient temperature [17, 23]. LTES is made up of two components: aquiferous low-temperature TES (ALTES) and cryogenic ...
