How does the energy storage module work?

what the Energy Storage Module is doing, charging early in the morning when the demand is low and discharging when the demand is peaking. The yellow line shows the net effect on shifted to off-peak periods. the electrical grid (a lower demand peak and a more balanced demand). Benefits:

The battery comprises a fixed number of lithium cells wired in series and parallel within a frame to create a module. The modules are then stacked and combined to form a battery rack. Battery racks can be connected in series or parallel to reach the required voltage and current of the battery energy storage system.
