A bidirectional push-pull/H-bridge DC/DC converter for a low-voltage energy storage system is proposed in this paper. It comprises the push-pull converter, the phase-shifted H-bridge converter, and the transformer. The push-pull converter is connected to the low-voltage side, and it is controlled by 0.5 fixed duty ratio.

The increasing power of battery energy storage systems (BESS) poses challenges to DC-DC converters in terms of efficiency, power density, and cost. To tackle these challenges and meet the requirements of voltage step-up/down between the DC bus and BESS in practical applications, a bidirectional (BD) step-up/down (SUD) series-connected partial power ...

lowered energy circulation at the expense of higher component count. In addition, CF full-bridge converters have demonstrated higher efficiency than their half-bridge and push-pull counterparts in similar applications [24]. The half-bridge at the VF side allows the use of filter capacitors with lower voltage ratings and the

This paper proposes a fast cell-to-cell balancing circuit for lithium-ion battery strings. The proposed method uses only one push-pull converter to transfer energy between high- and low-voltage cells directly for a fast balancing speed. The switch network for selecting a certain pair of cells is implemented using relays to achieve a low cost. The control circuit is composed ...

Therefore, the push-pull inverter is particularly suitable for ultrasonic applications for the reason that it reduces energy loss, saves circuit costs, and facilitates integration. For a high-efficiency system, the piezoelectric transducer must be driven at the resonant point to achieve maximum power transfer [13].

The waveforms demonstrate efficient energy storage and dissipation, reducing energy losses per cycle. This phenomenon culminates in improved selectivity in the frequency response of the system, thus enhancing its overall efficiency. ...
