Glenn Research Center at Lewis Field 5 FLYWHEEL ENERGY STORAGE FOR ISS Flywheels For Energy Storage o Flywheels can store energy kinetically in a high speed rotor and charge and discharge using an electrical motor/generator. IEA Mounts Near Solar Arrays o Benefits - Flywheels life exceeds 15 years and 90,000 cycles, making them ideal long

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = 1 \ 2 \ I \ o \ 2 \ [J]$, where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm 2], and o is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

Flywheel energy storage is a promising technology for replacing conventional lead acid batteries as energy storage systems. Most modern high-speed flywheel energy storage systems (FESS) consist of a huge rotating cylinder supported on a stator (the stationary part of a rotary system) by magnetically levitated bearings.

Currently, the battery UPS is the most common energy storage technology with the most common battery type being lead-acid [1]. In this post, we will examine the benefits and shortfalls of each technology to identify their best application scenarios. ... In summary, there are benefits and drawbacks for both the battery and flywheel technologies ...
