The technology is called KERS (Kinetic Energy Recovery System) and consists of a very compact, very high speed flywheel (spinning at 64,000 rpm) that absorbs energy that would normally be lost as heat during braking. The driver can flick a switch on the steering wheel so the flywheel temporarily engages with the car's drive train, giving a ...

Hybrid traction system, which combines motor-generator power source with mechanical flywheel energy storage system Schematic of a closed-loop control system for the DC motor with PID controller

The electricity is then transmitted through the third rail and used to increase the rotational speed of the flywheel. This energy is then recovered to power the train when it pulls out of the station. Carefully managed

train synchronization and "smart" digital technology are used to efficiently coordinate the energy flows.
