Flywheel Energy Storage System (FESS) has the advantages of high instantaneous power, high energy storage density, high efficiency, long service life and no environmental pollution. In this paper, the FESS charging and discharging control strategy is analyzed, and the active disturbance rejection control (ADRC) strategy is adopted and improved.

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. The energy is converted back by slowing down the flywheel. Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy  $E$  according to (Equation 1)  $E = \frac{1}{2} I \omega^2$  [J], where  $E$  is the stored kinetic energy,  $I$  is the flywheel moment of inertia [kgm<sup>2</sup>], and  $\omega$  is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...
