

In the Boost Converter circuit, when the transistor switch is fully-on, electrical energy from the supply, V_{IN} passes through the inductor and transistor switch and back to the supply. As a result, none of it passes to the output as the saturated transistor switch effectively creates a short-circuit to the output. This increases the current flowing through the inductor as ...

According to the BP Energy report [3], renewable energy is the fastest-growing energy source, accounting for 40% of the increase in primary energy. Renewable energy in power generation (not including hydro) grew by 16.2% of the yearly average value of the past 10 years [3]. Taking wind energy as an example, the worldwide installation has reached 539.1 GW in ...
