

Various enhancement techniques are proposed in the literature to alleviate heat transfer issues arising from the low thermal conductivity of the phase change materials (PCM) in latent heat thermal energy storage systems (LHTESS). The identified techniques include employment of fins, insertion of metal structures, addition of high conductivity ...

In concentrating solar power systems, for instance, molten salt-based thermal storage systems already enable a 24/7 electricity generation. The use of liquid metals as heat transfer fluids in thermal energy storage systems enables high heat transfer rates and a large operating temperature range (100°C to >700°C, depending on the liquid metal).

Interesting results were also obtained by Murray and Groulx, who created an experimental setup to study the heat transfer and phase change behavior of a PCM inside a vertical cylindrical latent heat energy storage system, during consecutive and simultaneous cycles of charging and discharging. They found that the effect of natural convection was ...

The heat transfer coefficient of a heat exchanger is easily affected by the heat flow rate (corresponding to the load rate of compression/power generation) while working on the off-design condition. Therefore, based on the heat transfer equation in, this section establishes an off-design model of heat exchanger in charge and discharge process.

The experimental setup is equipped with a thermoregulator TOOL TEMP TT180, and a cooling system. The system is provided with a bypass which can be used to circulate the Heat Transfer Fluid (HTF) without passing through the exchanger (Fig. 1) allows to heat the HTF before passing through the exchanger containing the PCM still cold (energy storage) or ...

Thermal energy storage (TES) techniques are classified into thermochemical energy storage, sensible heat storage, and latent heat storage (LHS). [1 - 3] Comparatively, LHS using phase change materials (PCMs) is considered a better option because it can reversibly store and release large quantities of thermal energy from the surrounding ...

thermal energy storage system for heat recovery in compressed air energy storage technology. Appl. Energy, 205 (2017), pp. 280-293.

To overcome this drawback, it is required to speed up the heat transfer process and conductivity of the storage material. Latent Heat Thermal Energy Storage Systems (LHTESS) have been optimized using various techniques, as shown in Fig. 3. These techniques include increasing heat transfer surfaces by redesigning heat exchange surfaces and fins ...

This paper examined the features of three typical thermal storage systems including: (1) direct storage of heat transfer fluid in containers, (2) storage of thermal energy in a packed bed of solid ...

Thermal energy storage using phase change materials (PCM) proved to be a promising technology because of its relative advantages over the other types of energy storage methods. Along with thermophysical properties of PCM, the performance of latent heat based thermal energy storage system depends on the design of the heat exchanger.

The thermo-hydraulic performance of a cryogenic printed circuit heat exchanger for liquid air energy storage was studied. The nature of flow and heat transfer was analyzed using the latest vortex identification methods. The effect of the inclined angle (0° , 15° , 30° , 45° , and 60°) was discussed, and the best angle was obtained using ...

An experimental characterization of a latent heat energy storage system (LHESS) with dodecanoic acid as the phase change material and a coil-in-tank heat exchanger was conducted in order to ...
