Authors to whom correspondence should be addressed. Solid-state hydrogen storage technology has emerged as a disruptive solution to the "last mile" challenge in large-scale hydrogen energy applications, garnering significant global research attention.

Can solid-state materials be used in a hydrogen storage link?

If solid-state materials are used in the hydrogen storage link, the system efficiency can be increased by 10-20%. It is estimated that by 2025, about 5% of China's communication base stations are expected to realize solid-state hydrogen energy storage replacement, with a market scale of about USD 710 million.

Are solid-state hydrogen storage materials economically feasible?

To be economically feasible, solid-state hydrogen storage materials must exhibit long-term stability and endurance. Comprehensive studies that analyze the deterioration processes of storage materials under real-world settings, including temperature fluctuations and cycling, are lacking in the literature. 6. How can we improve hydrogen storage capacities and kinetics in solid-state materials?

To improve hydrogen storage capacities and kinetics in solid-state materials, future research should strive to uncover novel sorption processes such as quantum effects and confinement. Scalable manufacturing procedures must be developed to move solid-state hydrogen storage from the laboratory to real-world applications.

How can a solid-state hydrogen storage heating network save energy?

In terms of heat source selection, in addition to electric heating, the waste heat of fuel cells and internal combustion engines, or renewable energy sources such as solar energy and geothermal energy, can be used to build an efficient and energy-saving solid-state hydrogen storage heating network.

Recently, high-entropy alloys (HEAs) designed by the concepts of unique entropy-stabilized mechanisms, started to attract widespread interests for their hydrogen storage properties. HEAs with body-centered cubic (BCC) structures present a high potential for hydrogen storage due to the high hydrogen-to-metal ratio (up to  $H/M = 2$ ) and vastness of compositions. ...
