The Piusi K90 Fuel Flow Meter is a nutating disk mechanical meter with a large mechanical display to make it easier to see the quantity of fuel that has been dispensed. Unlike other flow meters the Piusi K90 has a 90 degree inlet and outlet which can't be rotated, please view the image and choose the orientation which suits you best.

The meter used a brake magnet to ensure a wide measuring range and was equipped with a cyclometric register. Ganz started production in the same year. The first meters were mounted on a wooden base, running at 240 revolutions per minute, and weighed 23 kg. By 1914, the weight was reduced to 2.6 kg.

While PD meters are operated by the kinetic energy of the flowing fluid, metering pumps (described only briefly in this article) determine the flow rate while also adding kinetic energy to the fluid. The turbine flow meter consists of a multi-bladed rotor mounted at right angles to the flow, suspended in the fluid stream on a free-running bearing.

Hence, mechanical energy storage systems can be deployed as a solution to this problem by ensuring that electrical energy is stored during times of high generation and supplied in time of high demand.

Energy storage flywheel systems are mechanical devices that typically utilize an electrical machine (motor/generator unit) to convert electrical energy in mechanical energy and vice versa. Energy is stored in a fast-rotating mass known as the flywheel rotor. The rotor is subject to high centripetal forces requiring careful
