1. Introduction. Large-scale distributed photovoltaic grid connection is the main way to achieve the dual-carbon goal. Distributed photovoltaics have many advantages such as low-carbon, clean, and renewable, but the further development is limited by the characteristics of random and intermittent [1]. Due to the adjustable and flexible characteristics of the energy ...

The operation of microgrids, i.e., energy systems composed of distributed energy generation, local loads and energy storage capacity, is challenged by the variability of intermittent energy sources and demands, the stochastic occurrence of unexpected outages of the conventional grid and the degradation of the Energy
