The voltage controller maintains the inverter dc-link voltage at its reference level by controlling the real power flow. The power output of the inverter has ensured to be same as the power, obtained from the PV modules. Through the conversion, real and reactive currents are decoupled and can be controlled independently.

Full name of the micro inverter is micro solar on grid inverter. It generally refers to inverters with power below 1500W and module-level MPPT. It is mostly used in photovoltaic power generation systems. Micro is relatively small compared to traditional centralized inverters. The micro inverter inverts each component.
