How does a shared energy storage system work?

The shared energy storage system effectively facilitates energy exchange among multiple Microgrid and achieves full charging cycles. Figures 6, 7, and 8 represent the power balance scheduling results for Microgrid A, Microgrid B, and Microgrid C, respectively, in the multi-microgrid shared energy storage system.

What is the business model of a shared energy storage system?

The business model of the shared energy storage system is introduced, where microgrids can lease energy storage services and generate profits. The system is optimized using an economic double-layer optimization model that considers both operational and planning variables while also taking into account user demand.

How much power does a shared energy storage system have?

It can be observed that the shared energy storage system is actively involved in the energy dispatch of all VPPs throughout the day. The system reaches its maximum discharge power of 285 kW at 13:00 and maximum charge power of 371 kW at 12:00. Throughout most of the day, the charge and discharge power remains around 100 kW.

What is shared energy storage service?

Shared storage service is an effective approach toward a grid with high penetration of renewable energy. The application prospects of shared energy storage services have gained widespread recognition due to the increasing use of renewable energy sources.

What is a shared energy storage station?

The shared energy storage station provides leasing services to multiple microgrids, enabling microgrids to use energy storage services without building their own energy storage systems.

What is shared energy storage optimization?

A shared energy storage optimization configuration model for a multi-regional integrated energy system, for instance, is built by the literature. When compared to a single microgrid operating independently, this paradigm increases both the rate at which renewable energy is consumed and the financial gains.
