Comme toutes les batteries, la batterie sodium-ion stocke de l'énergie électrique via des liaisons chimiques qui peuvent se faire et se défaire côté anode.Quand la batterie est en charge des ions Na+ se « désintercalent » et migrent vers l'anode. Durant le temps d''équilibrage de charge, des électrons migrent de la cathode vers l''anode à travers le circuit externe contenant le chargeur.

The project represents the first phase of the Datang Hubei Sodium Ion New Energy Storage Power Station, which consists of 42 battery energy storage containers and 21 sets of boost converters. It uses 185 ampere-hour large-capacity sodium-ion batteries supplied by China's HiNa Battery Technology and is equipped with a 110 kV transformer station.

With sodium's high abundance and low cost, and very suitable redox potential (E (Na + / Na) ° =-2.71 V versus standard hydrogen electrode; only 0.3 V above that of lithium), rechargeable electrochemical cells based on sodium also hold much promise for energy storage applications. As a result, BloombergNEF predicts that sodium-ion batteries will make up 12% of the market for stationary energy storage by 2030. Natron, based in the San Francisco Bay Area, will target data centers, which use copious amounts of energy and frequently switch servers on and off. Artificial intelligence will only add to their energy needs.

Conversely, sodium-ion batteries provide a more sustainable alternative due to the tremendous abundance of salt in our oceans, thereby potentially providing a lower-cost alternative to the rapidly growing demand for energy storage. Currently most sodium-ion batteries contain a liquid electrolyte, which has a fundamental flammability risk.

The New York Times points out that because sodium-ion batteries have lower energy densities, more of them are needed to equal the energy capacity of lithium-ion batteries. That means more space is ...
