

If the voltage of the energy storage system always stays below the trolley voltage, a buck-boost DC chopper as given in Figure 3 is most suitable. In Trolley Mode, the converter works as a step-down chopper providing a voltage lower than the trolley supply to the trolleybus" internal systems.

1. In Trolley Mode, well controlled charging of the energy storage from the DC trolley systems has to be possible. This correlates to an input voltage range from 400VDC to 1000VDC. 2. In ...

Retard energy regenerated from an electrical motor during braking action is reinjected into a power system via trolley lines. The retard energy may be transmitted to a bidirectional electric substation and returned to a utility grid. The retard energy may also be transmitted to an auxiliary energy storage system, such as an ultracapacitor system or a battery system.
