This chapter describes the basic principles of electrochemical energy storage and discusses three important types of system: rechargeable batteries, fuel cells and flow batteries.

What are the different types of energy storage devices?

Therearedifferentwaystostoreenergy:chemical,biological,electrochemical,electrical,mechanical,thermal,andfuelconversionstorage.Thischapterfocuses on electrochemical energy storage and conversion.Traditionally,batteries,flowbatteries,andfuelcellsare considered as electrochemical energy storage devices.

What are electrochemical energy storage/conversion systems?

Electrochemical energy storage/conversion systems include batteries and ECs. Despite the difference in energy storage and conversion mechanisms of these systems, the common electrochemical feature is that the reactions occur at the phase boundary of the electrode/electrolyte interface near the two electrodes .

How are chemical energy storage systems classified?

Chemical energy storage systems are sometimes classified according to the energy they consume,e.g.,as electrochemical energy storage when they consume electrical energy,and as thermochemical energy storage when they consume thermal energy.

Can electrical energy be stored electrochemically?

Electrical energy can be stored electrochemically in batteries and capacitors. Batteries are mature energy storage devices with high energy densities and high voltages.
