What is the future of energy storage storage capacity?

188 MIT Study on the Future of Energy Storage storage capacity to 2-4 hours of mean system load in the 5 gCO₂/kWh case. In the regions where the model allows for intra-region transmission expansion, we also see 46 GW (Southeast) and 55 GW (Northeast) of added transmission capacity in the 5 gCO₂

What is the future of energy storage integration?

166 MIT Study on the Future of Energy Storage integration, by contrast, are expected to account for only a very small share (approximately 0.5%) of hydrogen demand. Increased demand for "green" hydrogen will drive down the cost of green hydrogen production technologies, eventually making power generation via hydrogen more cost competitive.

How important is energy storage in future electricity systems?

The model results presented in this chapter focus on the value of energy storage enabled by its arbitrage function in future electricity systems. Energy storage makes it possible to defer investments in generation and transmission, reduce VRE curtailment, reduce thermal generator startups, and reduce transmission losses.
